Boom Lifts

Boom Lifts are a table lift piece of equipment which could be raised or lowered to differing heights, making this machine a handy tool for certain manufacturing uses. There are many unique varieties of Boom Lift consisting of knuckle booms, scissor platform lifts, and aerial lifts, each functioning in a different way.

The common aerial lift variation is frequently utilized at skiing lodges to carry people who are not comfortable with the snowboard lift. Working in a manner similar to that of an elevator, snowboarders are transported up the mountain gradually, stopping at stations along the way until they reach the apex. Aerial hoists are also utilized in construction, moving personnel securely up and down the sides of multi-level construction sites.

Scissor lifts are quite regularly utilized by utility companies as the ideal method to safely enable personnel to repair and work on cables and wires attached to poles. Telephone, cable and power companies have relied on the effectiveness of this style of boom lift for years.

The knuckle boom lift is built for use within locations of bumpy ground and where the need to reverse course may be necessary. This style of boom jack has the ability to fit in tight spots where a scissor jack cannot fit. Working among multiple machines in a manufacturing plant or in near proximity sandwiched between two walls, the knuckle boom additionally features a standard table equipped with rails for security and employee safety.

The type of boom jack required by firms will sometimes depend on the nature of the job needed. Fortunately, there are suitable types for almost any duty.
