

Red Deer Manlift Training

Red Deer Manlift Training - Various manlift training courses include the review and content of manlift devices. An important part of the program is the practicum where students demonstrate their practical ability and knowledge to safely operate a manlift. A prerequisite to Manlift training is the fall protection training, which can be included in the training based on the specific needs of the client.

Course Content

The course content consists of: the effect of doing unsafe acts or utilizing unsafe equipment, pre-shift equipment inspection and work area survey requirements, Review of load capacities, Lifting device machine definitions, safety decals and particular machine requirements, Review of related sections of the OSHA Standards as well as the CSA Standards and Review site particular Dangers, along with controls for safe operation of a lifting device.

Demonstration and Evaluation Content

Evaluation and demonstration content consists of: Utilizing a signaler or a spotter when required; Proper personal protective equipment or likewise referred to as P.P.E. as needed; using a lift just on solid and level ground; Making use of a correct fitting harness or fall arrest device; Aware of load limits and all that and other specs set out by the manufacturer; Operating the lift with all other employees clear of the job place; Pre-shift work area survey and machine inspection; Having all associated machinery safely stored on the lift platform; Isolating off the work area when major work projects are to be carried out; and ensuring a safe and smooth operating speed for different plant conditions

Each of the trainees would undergo testing to make certain that they can safely operate their equipment.

Manlift Safety

Manlifts can be extremely dangerous machines because they are capable of lifting a worker 20 feet or higher in the air and that creates a particular amount of danger. As the danger is so apparent, lift owners and operators are careful to properly maintain their equipment and follow proper operating procedures and safety precautions. The ratio of accidents involving this specific machine is quite low.

The safe use of the scissor lift, manlift and the boom lift is up to the operator of that equipment. They have to know all of the responsibilities that go with running the machinery and how to use the lift vehicle safely. The most basic safety features on the machinery are the operating manual and safety decals. These show essential information about the maintenance, operating procedures and safety equipment.

Newer lift models will come together with manuals and decals in place. Technically, the operating handbook must be kept on the lift itself. If you are buying a used lift, it is essential to ensure that the guidebook is included and that essential decals haven't been painted over. The restraints which prevent operators from falling and the guardrails are other essential safety features. These are mandatory and standard on all kinds of lifts.
