

## Red Deer Zoom Boom Ticket

Red Deer Zoom Boom Ticket - Zoom Boom Training focuses on properly training prospective operators on variable reach forklifts. The training objectives consist of gaining the knowledge of the machine's physics and to be able to define the tasks of the operator. This program adheres to North American safety standards for lift trucks. Zoom boom training and certification is accessible at the company's location or at our site, provided there are a minimum number of people training. Certification received upon successfully completing it is good for three years.

The telehandler or also known as a telescopic handler is similar in various ways to a common forklift or a crane. This versatile equipment is constructed along with a telescopic boom that can lift upwards and extend forward. A variety of attachments can be connected on the end of the boom, such as pallet forks, bucket, lift table or muck grab. It is popular in industry and agriculture settings.

Telehandlers are most usually used together with the fork attachment to be able to shuttle loads. The units have the advantage that they could get to places not accessible to regular forklifts. Telehandlers are capable of removing loads which are palletized from within a trailer and placing them on places which are high like for instance rooftops. For some applications, they could be much more practical and efficient than a crane.

While lifting heavy loads, the telehandler could experience some instability. When the boom is extended very far with a load, the machine would become more unstable. Counterweights in the rear help, but do not solve the problem. The lifting capacity rapidly decreases as the working radius increases. Several machines come along with front outriggers that extend the lifting capacity whilst the machine is stationary.
